IN PARTNERSHIP WITH

SESSION AGENDA

01	Why Stellar, why now	20 MIN
02	Find your Stellar use case	20 MIN
03	Build with AI and Soroban (hands-on)	75 MIN
04	Pitches + Beyond HackMeridian	40 MIN

WHY DOES THIS CHAIN EXIST?

“MOVING MONEY
IS STILL SLOW
AND EXPENSIVE.”

HACK

THE ANSWER

BUILT TO MOVE VALUE

Stellar exists to fix that, by design:

- Settlement in seconds, fees in fractions of a cent
- Fiat on and off ramps, standardized via anchors and SEPs
- Assets native to the chain; smart contracts when you need them

STELLAR RUNS REAL MONEY

Built for payments, ramps and tokenized assets. In production and in the pipeline:

- Live: MoneyGram cash network for on and off ramps
- Live: USDC since 2021, EURC, PayPal PYUSD since 2025
- Pipeline: DTCC tokenization work

FIND YOUR USE CASE

FOUR PATTERNS THAT WIN

Pick the one closest to your problem, then write one line: I move X between Y and Z, and today it costs me W.

- Cross-border payment
- Anchor: fiat on and off ramps
- Tokenized real-world asset
- Agentic payment (x402)

SMART CONTRACTS ON STELLAR

01

RUST → WASM

You write Rust; it compiles to a WASM file of a few KB. That file IS the contract.

02

RUNS ON-CHAIN

No separate chain, no L2: the same network that moves the money executes the code.

03

TWO NAMES, ONE THING

Soroban = Stellar smart contracts. The SDK and RPC still carry the old name.

THREE THINGS TO REMEMBER

BUILDER BASICS

01

NO GAS TOKEN

Fees are XLM, in stroops. A transaction costs fractions of a cent.

02

RUST TO WASM

Local tests run the exact on-chain environment, so they can be trusted.

03

STATE PAYS RENT

Contract storage has a TTL. Extend it or it expires.

ACCOUNTS IN 60 SECONDS

01

A KEYPAIR

Public address starts with G, secret key with S. The CLI stores yours under an alias like alice.

02

ALIVE WHEN FUNDED

An account exists once it holds XLM (1 XLM minimum balance). On testnet, Friendbot funds it for free.

03

SIGN + SEQUENCE

Every transaction is signed by an account, pays its fee in XLM and bumps a sequence number.

NEW TO BLOCKCHAIN?

YOUR FIRST MENTAL MODEL

No crypto background needed today. Three ideas carry the whole session:

- A blockchain is a shared database nobody owns; the network agrees on its content every few seconds
- Your account is a keypair: the public part is your address, the secret part signs what you approve
- A smart contract is a small program stored in that database; its rules apply to everyone, always
- Today you will put one there yourself

FOR SOLIDITY PEOPLE

SAME IDEAS, NEW SPELLING

Three things actually change coming from the EVM:

- `require_auth`: authorization is explicit, per address
- Storage pays rent: entries have a TTL and expire
- Tests run the real host, not a simulation

BEFORE THE BREAK

STELLAR BASICS

If you forget everything else, build with these seven:

- Account = keypair: G public, S secret. Minimum balance: 1 XLM (two 0.5 base reserves)
- Fees are XLM in stroops, min 100 per operation. No separate gas token, fractions of a cent
- Testnet is free: Friendbot gives 10,000 XLM. It resets a few times a year
- A contract is a WASM file compiled from Rust; its address starts with C
- Authorization is explicit: `address.require_auth()`. There is no `msg.sender`
- Storage pays rent (TTL, time to live): extend it or it expires
- Your local tests run the real chain host: a green test means something

THE GOLDEN PATH

01
FUND

Freighter wallet plus Friendbot: 10,000 test XLM.

02
BUILD

Rust contract compiled to WASM with the Stellar CLI. One command to testnet. You get a contract ID.

03
DEPLOY

04
INVOKE

Call it live and see it on the explorer.

THREE WAYS IN

01

CODESPACES

One click on the repo badge. Rust, the wasm target and the CLI preinstalled. Today's path.

02

YOUR LAPTOP

rustup, the wasm32v1-none target, cargo install stellar-cli. Homework, not a live activity.

03

BROWSER ONLY

stellaride.dev: zero installs, no GitHub account. The fallback that always works.

EVIDENCE

SMALL BY DESIGN

1.2 KB

The workshop contract, compiled to WASM.
Fees to deploy and call it: fractions of a cent,
paid in XLM.

OUR GUESTBOOK WASM

BAR LENGTHS ARE ILLUSTRATIVE MAGNITUDES

YOUR AGENT KNOWS STELLAR

Stellar ships official context for coding agents. Watch the difference:

- skills.stellar.org:/plugin install stellar-dev@stellar-dev
- Raven MCP: live ecosystem docs for your agent
- llms.txt: the docs in machine-readable form

WHAT THAT MEANS

THE AI STACK, LINKED

Official context your agent reads before it writes code. Take these home:

- skills.stellar.org · official skills for Claude Code, Cursor, Codex
- raven.stellar.org · live docs and ecosystem data over MCP
- developers.stellar.org/llms.txt · the docs in machine-readable form
- developers.stellar.org/docs/build/building-with-ai · the official guide
- github.com/vestival/stellar-workshop-spain · today's workshop repo, exercises included

Next Page

01 · CONTEXT

Lock, decide, release: 120 lines of Rust.

02 · DECISION

Deployed and invoked live, right now.

03 · RESULT

Your turn: same repo, your machine.

THE COMMANDS, DECODED

Six commands take you from source code to a live contract:

- cargo test · runs the tests locally against the real Soroban host, no network
- stellar keys generate --fund alice · creates a keypair; Friendbot funds it with 10,000 test XLM
- stellar contract build · compiles the Rust into a .wasm file, your whole contract
- stellar contract deploy --wasm ... · uploads it to testnet, returns your contract ID (C...)
- stellar contract invoke --id ... -- sign · a signed call to the live contract; after the -- comes the function
- "Test SDF Network ; September 2015" in the output is the network's name (its passphrase), not a date

THREE THINGS TO REMEMBER

AFTER LISBON

01

SCF

Stellar Community Fund: up to \$150k
in tranches tied to milestones.

02

CV LABS

EMEA accelerator pathway for teams
that keep building.

03

AMBASSADORS

Stellar's global community-builder
network.

KEEP BUILDING

APPLY TO HACKMERIDIAN

Lisbon, October 25 and 26. Travel support available. Applications close October 19, so apply this week.
