Project & Evidence Canvas: Tramo

Page 1 decides what you build. Page 2 proves it. Fill it in as a team, in pencil first.

Team	Project name	Track
Two people: one developer, one translator who does product	Tramo	☒ Genesis ☐ Scale

1. User

Who has the problem? Role, place, size. "Freelancers" is too broad to decide anything.

Freelance translators in Spain who work for agencies abroad and are paid per project in two or three instalments.

2. Problem today

What goes wrong now, how often, and what it costs the user.

The translator delivers part of a job, then waits for the agency to approve it and send an international transfer, with fees on the way. There is no shared record of what was approved and when.

3. Alternatives

Include what people use today without blockchain: a spreadsheet, a bank transfer, doing nothing.

Alternative	What it does well	Where it fails for our user
Bank transfer after each delivery	Familiar, no setup	Slow and costly across borders; nothing links approval to payment
Freelance platform with escrow	Protects the payment	High commission; agency and translator must both live on the platform
Spreadsheet plus invoices	Free and flexible	Nothing enforces payment once a milestone is approved

4. Our difference

One thing we do that the alternatives do not.

The agency locks the whole budget up front. Each approved milestone releases its share in seconds, and both sides see the same record.

5. Why Stellar

What breaks or gets worse without it? Name the piece: a contract, a stablecoin, an anchor, an existing protocol.

A Soroban contract holds USDC and releases a milestone only when the agency signs the approval. Settlement takes seconds and fees are fractions of a cent. Paying in a stablecoin keeps the translator away from XLM price moves.

6. Value proposition

For [user] who [problem], we [result], using Stellar to [reason].

For freelance translators paid by foreign agencies in instalments, we release each approved milestone in seconds, using a Stellar contract that holds the funds until approval.

HYPOTHETICAL EXAMPLE. Tramo, its users and its evidence are invented to show how the templates are filled in. Nothing on this page describes a real project, person or result.

7. MVP scope

Only what the demo journey needs. Everything else goes to the roadmap slide.

Build during the event	Roadmap (not now)
Project with three milestones	Disputes and arbitration
Agency funds the contract with test USDC	Fiat off-ramp through an anchor
Agency approves a milestone; contract pays the translator	Invoices and tax documents
Status page with explorer links	Other currencies and a mobile app

8. Demo journey

One user, one journey, ending in something a judge can check.

#	What the user does	What Stellar does	What a judge can check
1	Agency creates a three-milestone project	Contract deployed; budget locked in USDC	Contract ID and lock transaction
2	Translator marks milestone 1 as delivered	State change stored in the contract	Contract state
3	Agency approves milestone 1	require_auth on the agency; payout of that share	Payment transaction on the explorer
4	Agency tries to approve the same milestone again	Contract rejects the call	Failed call shown on screen

9. Evidence matrix

OFFICIAL rows come from the HackMeridian Lisbon 2026 FAQ. WORKSHOP rows are our recommendations, not scoring rules. Check the latest event rules before you submit.

Source	Criterion or priority	Our claim	Evidence	Link or location	Owner / status
OFFICIAL	Smart contracts	Escrow contract holds and releases funds	Deployed contract; tests	README, Proof section	Dev: done
OFFICIAL	Smart accounts	Not used			n/a
OFFICIAL	Cross-chain transfers	Not used			n/a
OFFICIAL	Clear README with how it works and specs	Anyone can run and verify it	README with diagram	Repo root	Product: in progress
WORKSHOP	Real user need	Translators wait on approval and payment	Notes from three conversations, shared with consent	docs/interviews.md	Product: done
WORKSHOP	Difference vs alternatives	Locked budget plus instant release	Comparison table	README	Product: done
WORKSHOP	Verifiable result	Payout happens on testnet	Explorer links	README, Proof section	Dev: done

10. Open dependencies and risks

Dependency	Plan B	Owner
Test USDC available on testnet	Team-issued test token, labeled as such in the demo	Dev
Agency wallet signing works on the demo laptop	Pre-funded demo account; recorded backup run	Dev

HYPOTHETICAL EXAMPLE. Tramo, its users and its evidence are invented to show how the templates are filled in. Nothing on this page describes a real project, person or result.

Demo & Pitch Playbook: Tramo

Three minutes to show one working journey. These timings are a teaching default: adapt them to the event limits.

A. The three-minute script

Say and show are different jobs: your voice explains why, the screen proves what.

Time and goal	What we say	What is on screen
0:00 to 0:20 Who has the problem and what they need	A translator in Valencia finishes the first part of a job for an agency abroad. Then she waits for approval and an international transfer.	One slide: the problem in one line
0:20 to 0:40 How the project solves it and what Stellar adds	Tramo locks the agency budget in a Stellar contract. Each approved milestone pays out in seconds.	Diagram: agency, contract, translator
0:40 to 2:10 One complete journey, ending in a verifiable result	Narrate the four steps: create, deliver, approve and get paid, then the rejected double approval.	Live app, then the explorer tab with the payment
2:10 to 2:40 What you built, what you validated, what is still limited	We built the contract and status page here, reusing the workshop escrow pattern. The USDC is a labeled test token; the fiat off-ramp is roadmap.	README, Honesty section
2:40 to 3:00 The value you showed and the next step	Approval and payment become one step. Next: two agencies willing to pilot it.	Contract ID and repo QR

E. Likely judge questions

Likely question	Our one-line answer
What is on-chain and what is not?	Funds, approvals and payouts are on-chain. Project names and delivery notes live in our app.
What did you build during the event?	The contract logic for milestones, the status page and the demo flow. The escrow pattern comes from the workshop repo.
Who asked for this?	Three translators we spoke to before the event; notes in docs/interviews.md.

Submission Checklist: our top three fixes

The checklist is the same for every team. What changes is the top three fixes.

#	Fix	Owner
1	Ask someone outside the team to run the setup on a clean laptop	Dev
2	Record the backup run and link it from the README	Product
3	Add the consent note to docs/interviews.md	Product
